Abstract

This paper gives a review on the indications, impact factors, contraindications, and research development of oncological hyperthermia. It also gives an introduction to the development, mechanism and method of the hyperthermia application in hot spring life cultivation. In addition, this paper also concludes that hot spring reaches the goal of life cultivation through a combination of physical effects (temperature, buoyancy, pressure) and chemical effects (microelements). It is also proposed that hot spring life cultivation should work in accordance with the time, local and individual conditions.
