Marcell A. Szasz (2019): Conventional, „standard” chemotherapy protocols for modulated electro-hyperthermia (mEHT, trade name: oncothermia ®),  
Oncothermia Journal 25: 131-  
[www.oncothermia-journal.com/journal/2019/Conventional\\_standard\\_chemotherapy.pdf](http://www.oncothermia-journal.com/journal/2019/Conventional_standard_chemotherapy.pdf)

My objective to collect the standard protocols, which are conventionally in use together with modulated electro-hyperthermia (mEHT). These protocols do not contain the newest non-chemo-based therapies, like antibodies, gene therapies, immune-therapies, check-point-inhibitors, CAR T-cell therapy, etc., limited only on the classical chemotherapies, which are widely used in first- and second-line therapies. The protocols intended to help the mEHT professionals to choose the best protocol for their patients. The protocols show only one cycle of mEHT fitted to the given chemotherapy at first. It could be repeated with continuous basis on the same composition, or when a longer period is in the protocol without administering chemo-therapy, but knowing the active effect on the disease, the mEHT could be continued at every second day as highest frequency of its application. When the toxicity of the chemo-therapy reaches its tolerance limit by repeated cycles, mEHT could be continued with control of its efficacy.

The collected protocols are:
